

README — Daily EERs (Monthly Real-Time Vintages)

When using this dataset, please cite the paper: McCarthy, M. and S. Snudden (2024). *Forecasts of Period-Average Exchange Rates: Insights from Real-Time Daily Data*, LCERPA Working Paper 2024-6.

Overview

This archive contains real-time vintages of daily nominal and real effective exchange rates (EERs) for 160 countries.

Each folder contains one CSV per country, identified by its ISO-3 country code (e.g., ALB.csv for Albania).

Notes:

- A detailed description of data construction and methodology is provided in Section 2 and Appendix C of the paper.
- Monthly aggregates (end-of-month and monthly average) derived from these daily vintages are available at <https://stephensnudden.com/data-code/>.
- Real and nominal bilateral exchange rates are not included in this archive. Please obtain them from the cited sources.

Folder Structure and Contents

1. Daily_NEER/ and Daily_REER/

Monthly vintages of daily nominal and real EERs.

- Each CSV has one column per monthly vintage.
- Vintages are based on bilateral nominal exchange rates (NER), nowcast CPI, and trade weights available at midnight on the last day of each month.
- Example: In Daily_REER/ALB.csv, the column titled Jan 2001 contains the real EER daily series as constructed using all information available on January 31, 2001.

2. Daily_NEER_actuals/ and Daily_REER_actuals/

Realizations (“actuals”) of the nominal and real EERs targeted by the forecasts.

- All actuals are constructed using the June 2023 vintage of NER and CPI, while retaining the trade weights available at the time of the forecast.
- Each CSV has one column per historical set of trade weights.
- Example: In Daily_NEER_actuals/ALB.csv, the column titled X1996–2003 contains NEER values computed using trade weights for the periods 1979–1989, 1990–1995, and 1996–2003, but not subsequent weights.

Usage in the paper

These data are used for real-time, out-of-sample forecast evaluation of EERs, including no-change and model-based forecasts. For each forecast at each vintage:

- Forecasts are constructed using real-time inputs from Daily_NEER/ or Daily_REER/.
- Forecast errors are calculated against realizations from Daily_NEER_actuals/ or Daily_REER_actuals/.

See Section 3 (“Out-of-sample evaluation”) of the paper for details.

Terms of Use

This dataset is available for academic use but not for resale.
